

Future Bookshelf

An AI book recommendation agent that turns a natural language goal into a grounded, personalized bookshelf.

Find your first book.
See your future bookshelf.
Follow your reading route.

Built with EdgeOne Makers + Open Library

The problem

Book discovery is still hard when your goal is vague, personal, or future-oriented.

Generic lists

Search engines and bestseller lists are not personalized to the user's goal, mood, or future identity.

Hallucinated AI picks

A normal chatbot can recommend books that sound plausible but are not grounded in a real catalog.

No reading route

Users often do not know which book to start with or how the books connect into a path.

The gap: people need a guide that is imaginative, but still grounded in real books.

The product

A three-step experience for turning intent into a bookshelf.

1. Find your first book

The agent interprets the prompt and identifies the most useful starting point for the user.

2. See your future bookshelf

It organizes real book candidates into meaningful shelves, not a plain search result list.

3. Follow your reading route

It provides a ranking and reading strategy so the user knows what to read next.

Designed for learning goals, entertainment moods, and identity-oriented prompts.

Agent workflow

The model reasons over real book candidates instead of inventing recommendations.

Anti-hallucination principle: final recommendations must use only books retrieved from Open Library.

Demo experience

Different prompts produce different bookshelf structures.

Learning

- Goal interpretation
- Learning roadmap
- Foundations / Core Concepts / Applications / Advanced

Entertainment

- Mood and genre interpretation
- Best Match / Light and Enjoyable / Classics / Hidden Gems
- Fit-based ranking

Future self

- Ideal future self description
- Foundations / Taste / Professional Growth / Deep Curiosity
- Why each book belongs on that shelf

Built for the hackathon demo

Simple, grounded, and ready to expand.
